Compactness estimates for the $\bar{\partial}$ -Neumann problem in weighted L^2 spaces

We discuss compactness of the $\bar{\partial}$ -Neumann operator and of the canonical solution operator for $\bar{\partial}$ in the setting of weighted L^2 -spaces on \mathbb{C}^n . For this purpose we use a version of the Rellich-Lemma for weighted Sobolev spaces. In this situation the behavior of the Laplacian as well as of the gradient of the weight function at infinity is of importance.

11:55–12:45 Robert Juhlin

A technique for proving convergence of formal power series using estimates

In this talk, I will present a technique for proving convergence of formal power series satisfying certain systems of equations. This is done by using a type of modified Cauchy estimates to estimate the coefficients. The technique can be used to prove convergence of Normal forms for some classes of real-analytic hypersurfaces in \mathbb{C}^2 .

13:45–14:35 Klaus Gansberger

The weighted $\bar{\partial}$ -Neumann problem on unbounded pseudoconvex domains

I will explain how methods used for bounded domains can be extended to treat unbounded pseudoconvex domains and give a sufficient condition for boundedness of the weighted $\bar{\partial}$ -Neumann operator in terms of the weight function. I will also present a condition for compactness which is the analogon of Property (P) introduced by Catlin and discuss under which additional assumptions on the boundary this can be weakened.

14:40–15:30 Martin Kolar

The Catlin multitype and local equivalence

We will consider the local equivalence problem for hypersurfaces of finite Catlin Multitype. The main tool is provided by a generalized Chern-Moser operator.

16:00 Tour of Villa Tugendhat (english)

When I let these areas and everything found within them affect me as a whole, then I see it quite clearly: That is beauty - this is truth. Truth - we can have various opinions on it, but anybody who sees these areas will realise sooner or later that this is a real work of art.

Fritz Tugendhat, 1931
